```
a gene or partial gene, using recombinatorial cloning. The method incubates nucleic acids comprising the expression signal and the gene/ partial gene in the presence of a recombination protein under conditions sufficient to cause recombination and therefore appose the expression signal and the gene or partial gene. The methods are useful for apposing an expression signal and a gene or partial gene using recombinatorial cloning. The methods are also or partial gene using recombinatorial cloning. The methods are also seful for changing vectors, constructing genes for fusion proteins, changing copy number, changing replicons, at one and a loxy site at the other end), genomic DNAs, and cDNAs. The methods are highly specific, rapid, and less labour intensive than prior art methods. The present sequence is a recombination site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method for apposing an expression signal and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Methods for apposing nucleic acids comprising an expression signal an a gena/partial gene, using recombinatorial cloning by incubating the nucleic acids in the presence of a recombination protein under conditions for recombination.
                                                                                                                                                                                                                                                         Recombination site; copy number; replicon; recombinatorial cloning;

```
The present invention relates to a method for in vitro cloning of a nucleic acid of interest. The method involves mixing in vitro two vectors each comprising at least one recombination site and the nucleic acid of interest; incubating the mixture in the presence of at least one recombination protein to result in recombination of the recombination sites, leading to production of a chimeric nucleic acid molecule comprising the nucleic acid of interest; contacting hosts with the mixture, and selecting for a host comprising the chimeric nucleic acid molecule, and selecting against a host comprising the vectors comprising the second vector; to clone the nucleic acid. The present sequence is a recombinantion site, which may be used in the method of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .

The present invention relates to a method for in vitro cloning of a nucleic acid of interest. The method involves mixing in vitro two vectors each comprising at lesst one recombination site and the nucleic acid of interest; incubating the mixture in the presence of at least one recombination protein to result in recombination of the recombination sites, leading to production of a chimeric nucleic acid melecule comprising the nucleic acid of interest; contacting hosts with the mixture; and selecting for a host comprising the chimeric nucleic acid mixture, and selecting for a host comprising the chimeric nucleic acid the second vector; to clone the nucleic acid. The present sequence is a recombinantion site, which may be used in the method of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated nucleic acid molecules comprising a DNA segment having two engineered recombination sites, derived from att or lox, which flank a

comprising a first nucleic acid sequence having a defined sequence comprising a first nucleic acid sequence complementary to AAC87866 to AAC87881.

Or an RNA sequence corresponding to AAC8786 to AAC87881. Also described are: (1) an isolated nucleic acid molecule (II) comprising a first mutated recombination site that removes one or more stop codons from the recombination site to avoids hairpin formation, the recombination site being an att or lox site; (2) an isolated nucleic acid molecule (III) comprising a first att recombination site comprising a first att recombination site comprising a first att recombination site comprising a mutation that above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids in (IV). The nucleic acids are used in entioned nucleic acids or (IV). The nucleic acids are used in consinering a core region of a given recombination site to provide mutative sites suitable for subcloning reactions. The use of nucleic acids for obtaining engineered recombination in vitro or in vivo makes the methods for DNA or RNA subcloning, highly specific, rapid, and ess labour intensive.

Recombinant nucleic acid vector for reducing tumour size, has expression cassette comprises a promoter linked to nucleic acid sequence encoding a syncytium-inducing polypeptide and flanked on either side by recombinase

Disclosure; Page 42; 84pp; English.

The present invention describes a vector (I) comprising operably linked DNA fragments having: (a) origin of replication allowing replication in a recipient cell, preferably in bacteria such as Escherichia coli.

(b) selectable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (i) promoter or promoter region capable of being recognized by RNA polymerases of a eukaryotic cell or by prokaryotic RNA polymerase; (ii) first, second, third and fourth recombination sites; (iii) 3' transcription terminating and polyadenylation region functional in the eukaryotic cell. The first and fourth recombination sites, or the second and third recombination sites, or the second and third recombination sites are capable of reacting with a same recombination site, and

The invention relates to a recombinant nucleic acid vector comprising a first expression cassette, comprising a first promoter operably linked to a nucleic acid acquence encoding a syncytum-inducing polypeptide (such as a fusogenic membrane glycoprotein) and flanked on either side by a sequence recognised by a recombinase, and/or a second expression cassette

comprising a tumour-specific promoter operably linked to a nucleic acid sequence encoding a recombinase. The nucleic acid of the first expression cassette may be linked to a hypoxic response element (HRE), the second expression cassette may contain a promoter linked to a nucleic acid encoding a cytokine, and a third cassette may contain a tumour specific promoter linked to the nucleic acid encoding the recombinase. The tumour specific promoter is, for example, a carcinoembryonic antigen (CEA) promoter or a tyrosinase promoter and the recombinase is, for example, or recombinase or FLP recombinase The invention is useful for reducing tumour size by administering the compositions as retroviral vectors, or in a cell containing the vector, to an individual in need of treatment for a disease caused by malignant cells. This sequence represents an Int recombinase site core region attR3, required for excisive recombination. ô New vectors comprising operably linked DNA fragments having an origin of replication, a selectable marker and a chimeric DNA construct, useful for silencing target nucleic acids and for producing large Gaps Chimeric nucleic acid construct, recombinational cloning; silencing; recombination site; double stranded RNA; plant; ss. ٠, 100.0%; Score 25; DB 23; Length 25; 100.0%; Pred. the third and fourth recombination sites, do not recombine with each other or with a same recombination site. The vector is useful for producing large amounts of double-stranded RNA which can be used for silencing target nucleic acid sequences. The vectors can also be used to convert a DNA fragment into an inverted repeat structure. Plants transformed with a vector from the present invention can be used to conventional breeding scheme to produce more plants with the same characteristics or to introduce a chimeric gene for reduction of the phenotypic expression of nucleic acids. The present sequence represents the core sequence of recombination site attBl which is given in the exemplification of the present invention.

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome expression system (ACes) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (M1) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (M1) is useful for introducing a heterologous nucleic acid into a platform artificial artificial chromosome, preferably an ACes. (II) is useful for transgenic animal (e.g. a fish, insect, reptile, amphibian, arachmid, or
                                                                                                                                         att site; integrase; recombinase; ACes; gene therapy; transgenic animal; platform artificial chromosome expression system; PCR primer; ss.

```

The present invention describes a vector (I) comprising operably linked recipient cell, preferably in bacteria such as Ilowing replication in a recipient cell, preferably in bacteria such as Escherichia coli; (b) selectable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising; (i) promoter or promoter region capable of being recognized by RNA polymerases of a ewkaryotic cell or by prokaryotic RNA polymerases; (ii) first, second, third and fourth recombination sites; (iii) 3' transcription terminating and polyademylation region functional in the eukaryotic cell. The first and fourth recombination sites, or the second and third recombination sites are capable of reacting with a same recombination site, and preferably are identical. The first and second recombination sites, or

New vectors comprising operably linked DNA fragments having an origin of replication, a selectable marker and a chimeric DNA construct, useful for silencing target nucleic acids and for producing large amounts of double-stranded RNA.

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes. The invention of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, trNA, rDNA, structural proteins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and proteins, and proteins, antipodies, no strokines, growth factors, antipodies, or stress in a plant. The resistance to diseases, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that provides and agronomically important trait in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial
                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic

```

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (1) a platform artificial chromosome expression system (ACes) (II) comprising several sites that participate in recombinase caralysed recombination; and (2) a method (M1) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (M1) is useful for introducing a heterologous nucleic acid molecule into a platform artificial artificial chromosome, preferably an ACes. (II) is useful for artificial chromosome, preferably an ACes. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammanl) by introducing (II) by cell fusion, lipical-mediated transfection by a carrier system, microbinection, microcell fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods for delivery of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transpanic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, tRNA, rDNA, structural proteins, marker proteins, lagands, receptors, ribozymes, therapeutic proteins, and in plant artificial proteins, vaccines, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistance to diseases, insects, herabloides, or stress in a plant. The reterologous nucleic acid optionally encodes a product that alters nutrient use and/or improves the nutrient engance and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (YAC). This polynucleotide sequence represents an oligo relating to the method for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Plant artificial chromosome, PAC, transgenic plant; vaccine,

AASO6174-AASO6322 represent Bacteriophage lambda att recombination site nucleic acid sequences, and PCR primers of the invention. The att sequences are recognised by the recombination protein lambda att sequences are recognised by the recombination protein lambda integrase (Int). The invention is a new method of producing a population of hybrid nucleic acids comprising mixing at least a first population of nucleic acids comprising one or more recombination sites with at least causing some or all of the nucleic acids to recombine with all or some of the target nucleic acids. The method is useful for producing a population of hybrid nucleic acids which may be the same or different. The nucleic acids may be used to express therapeutic proteins or peptides and they may also be used to each sovel fusion proteins by expressing different sequences linked to each other. The method allows simultaneous cloning of
                                                                                            ÷
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Producing hybrid nucleic acids, useful for expressing novel therapeutic polypeptides, by mixing the same or different nucleic acids having one or more recombination sites in the presence of recombination proteins,

the first population to recombine with the first target nucleic acid molecules to form a second population; (c) mixing the second population of nucleic acid with a second target nucleic acid, and (d) causing some or all of the nucleic acid molecules of the second population to recombine with some or all of the second target nucleic acid molecules to form a thirth population of nucleic acid. The method is useful for selecting and isolating nucleic acid molecules. Sequences AB258727-762 represent att recombination site sequences used in the method of the

```
The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attP1, attP2, attL1, attL2, attR1, and attR2 nuclectides sequence. Also described are: (1) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination sites and as escond att recombination site; and (2) an isolated nucleic acid molecule (III) comprising one or more mutated att recombination site and a second nucleic acid molecule least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising at second recombination site and a second nucleic acid molecule comprising a second recombination site that interacts with the mutated att recombination site and a second nucleic acid molecule comprising a second recombination site attoresses with the mutated att recombination are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting gene products to intracellular locations, classing lusion tages from desired proteins, operably linking nucleic acid molecules of interest to require to specially linking mucleic acid molecules of interest cephanging copy number, changing replicons, cloning into phages and cloning (1), (II), (III), host cells and vectors can be used in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attP1, attP2, attL1, attL2, attR1, and attR2 concoding an attB1, attB2, attP1, attP2, attL1, attL2, attR1, and attR2 conclided molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination sites and a second att recombination site, and (2) an isolated nucleic acid molecule (III) comprising one or more mutated att recombination site some region that enhances the efficiency of recombination between a first nucleic acid molecule comprising the mutated att recombination site and a second nucleic acid molecule comprising a second recombination site in that interacts with the mutated comprising a second recombination site ond a second nucleic acid molecule comprising a second recombination site ond a second nucleic acid molecules of intracellular locations, leaving fusion targe fine nucleic acid molecules. They can be used for changing vectors, targeting send proteins, operably linking nucleic acid molecules of interest to regulatory genetic sequences, constructing genes for fusion proteins, changing copy number, changing replicans, claning into phages and claning (I), (III), (III), host cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is used in the exemplification of the present invention. Isolated nucleic acid molecules encoding an attB1, attB2, attP1, attP2, attL1, attL2, attR1, and attR2 nucleotide sequence useful for the recombinational cloning of polypeptides -Bacteriophage lambda; att; recombination site; attB; attB; attL; attL; mutant; recombinational cloning; entry vector; destination vector; gene product targeting; fusion tag cleavage; ds. 100.0%; Score 25; DB 21; Length 4204; 100.0%; Pred. the present invertible interpretation artification and attract action and attract action and attract nucleotide sequence. Also described are: (1) an isolated nucleic acid nucleotide sequence. Also described are: (1) an isolated nucleic acid nucleotide sequence. Also described are: (1) an isolated nucleic acid molecule (11) comprising one or more act recombination site and a second attraction between the recombination site and a second attraction between the recombination site acid molecule (III) comprising one or more mutated attracombination site acid molecule comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising a second recombination site and a second nucleic acid molecule attracembination site. (II), (III), primers, vectors and methods from the present invention are used for the recombinational cloning of attraceombinations. They can be used for changing vectors, targeting gene products to intracellular locations, cleaving fusion tags from desired proteins, operably linking nucleic acid molecules of interest to required to proteins, constructing genes for tusion proteins, changing recombinations and methods are required proteins, operably linking nucleic acid molecules of interest to required the present invention are used for this proteins, operably linking nucleic acid molecules of interest to require the present interactions of agence for this proteins, changing recombinations and methods of interest to a regulatory genetic sequences, constructing genes for tusion proteins, changing recombinations and methods of interest to a required the present interactions of an interest constructing genes for tusion proteins, changing recombinations and methods and m
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated nucleic acid molecules encoding an attB1, attB2, attP1, attP2, attL1, attL2, attR1, and attR2 nucleotide sequence useful for the recombinational cloning of polypeptides -
                                                                      Bacteriophage lambda; att; recombination site; attB; attB; attL; mutant; recombinational cloning; entry vector; destination vector; gene product targeting; fusion tag cleavage; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         changing copy number, changing replicons, cloning into phages and cloning. (I), (II), (III), host cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present invention describes isolated nucleic acid molecules (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 4208 BP; 1172 A; 997 C; 875 G; 1164 T; 0 other;
                     Donor plasmid pDONR203 nucleotide sequence.

```
The invention relates to inserting a population of nucleic acids into a second target molecule. The method involves (a) mixing a first population of nucleic acid comprising one or more recombination sites with a target nucleic acid, (b) causing some or all of the nucleic acid molecules of the first population to recombine with the first target nucleic acid molecules of nucleic acid with a second population, (c) mixing the second population of nucleic acid, and (d) causing some or all of the nucleic acid, and (d) causing some or all of the second population to recombine with some or all of the second target nucleic acid molecules to form a third population of nucleic acid. The method is useful for selecting and isolating nucleic acid molecules. The present sequence represents the destination plasmid pDONR212 nucleotide sequence.
                                                                                                                                                                                                                                                                                                                            Inserting a population of nucleic acids into a second target molecule for selecting and isolating nucleic acid molecules by mixing the second population of nucleic acid with a second target nucleic acid -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bacteriophage lambda; att; recombination site; attB; attB; attL; attL; mutant; recombinational cloning; entry vector; destination vector; gene product targeting; fusion tag cleavage; ds.

```

```
The invention relates to inserting a population of nucleic acids into a second target molecule. The method involves (a) mixing a first population of nucleic acid comprising one or more recombination sites with a target nucleic acid; (b) causing some or all of the nucleic acid molecules of the first population to recombine with the first target nucleic acid molecules of nucleic acid with a second population; (c) mixing the second population or all of the nucleic acid molecules of the second population to recombine with some or all of the second target nucleic acid molecules to form a third population of nucleic acid. The method is useful for selecting and isolating nucleic acid molecules. The present sequence represents the destination plasmid pDONR201 nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inserting a population of nucleic acids into a second target molecule for selecting and isolating nucleic acid molecules by mixing the second population of nucleic acid with a second target nucleic acid -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        conciding an attB1, attB2, attB1, attB2, attB1, and attB2 nucleotide sequence. Also described are: (1) an isolated nucleic acid nucleotide sequence. Also described are: (1) an isolated nucleic acid molecule (11) comprising one or more att recombination sites comprising to finteraction between the recombination site and a second att recombination site; and (2) an isolated nucleic acid molecule (III) comprising one or more mutated att recombination sites comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule (III) comprising as second recombination site and a second nucleic acid molecule comprising the mutated att recombination site and a second nucleic acid molecule comprising the mutated attrecombination site that interacts with the mutated comprising a second recombination site that interacts with the mutated attrecombination site that interacts with the mutated comprising a second recombination site that interacts with the mutated attrecombination site that interacts with the mutated comprising a second recombination site that interacts with the mutated attrecombination site in the recombinational cloning of nucleic acid molecules. They can be used for changing vegetors, targeting genes products to intracellular locations, cleaving fusion tages from cegning copy number, changing replicons, cloning into phages and cloning. (I) (II), (II), host cells and vectors can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0;

The invention relates to inserting a population of nucleic acids into a second target molecule. The method involves (a) mixing a first population of nucleic acid comprising one or more recombination sites with a target nucleic acid, (b) causing some or all of the nucleic acid molecules of the first population to recombine with the first target nucleic acid molecules of nucleic acid with a second population; (c) mixing the second population of nucleic acid with a second target nucleic acid, and (d) causing some or all of the nucleic acid molecules of the second population to recombine with some or all of the second target nucleic acid molecules to form a third population of nucleic acid. The method is useful for selecting and isolating nucleic acid molecules. The present sequence represents the destination plasmid  ${ t pDONR212}(F)$  nucleotide sequence Sequence 4627 BP; 1262 A; 1126 C; 990 G; 1249 T; 0 other; 8888888888888888888

Isolated nucleic acid molecules encoding an attB1, attB2, attP1, attB2, attL1, attL2, attR1, and attR2 nuclectide sequence useful for the recombinational cloning of polypeptides -

Example 10; Fig 53; 459pp; English.

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, an isolated nucleic acid molecule (II) comprising one or more mutated att recombination site; and (2) an isolated nucleic acid molecule (III) comprising one or more mutated att recombination site and a second nucleic acid molecule (III) comprising a second recombination site and a second nucleic acid molecule comprising the mutated att recombination site and a second nucleic acid molecules. They can be used for the recombination site (I), (II), (III), primers, vectors and methods from the present invention are used for the recombinational cloning of seconds recombination site and second for changing vectors, targeting desired proteins, operably linking nucleic acid molecules of interest to regulatory genetic sequences, constructing genes for fusion proteins, changing replicons, cleaning into phages and cloning. (I), (II), (III), host cells and vectors can be used in the conding. (I), (III), host cells and vectors can be used in the used in the exemplification of the present invention.

```
The present invention describes a vector (I) comprising operably linked DNA fragments having: (a) origin of replication allowing replication in a recipient cell, preferably in bacteria such as Escherichia coli; (b) selectable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (i) promoter or promoter region capable of being recognized by RNA polymerases of a cukaryotic cell or by prokaryotic RNA polymerases of a third and fourth recombination sites; (iii) 3' transcription terminating and polyadenylation region functional in the eukaryotic cell. The first and polyadenylation region functional in the eukaryotic cell. The first and polyadenylation region functional in the eukaryotic cell. The first cand preferably are identical. The first and second and third recombination free the third and fourth recombination site, and second recombination site, and preferably are identical. The first and second recombination site, or the third and fourth recombination site. The vector is useful for producing large amounts of double-stranded RNA which can be used for silencing target nucleic acid sequences. The vectors can also be used conventional breeding scheme to produce more plants with the same conventional breeding scheme to produce more plants with the same recombined with a vector from the present invention can be used in a conventional breeding scheme to produce more plants with the same recombined which a minerial side of the convention of the conv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

New nucleic acid cloning methods

```
New vectors comprising operably linked DNA fragments having an origin of replication, a selectable marker and a chimeric DNA construct, useful for silencing target transletic acids and for producing large amounts of double-stranded RNA -
                                    Chimeric nucleic acid construct; recombinational cloning; silencing; recombination site; double stranded RNA; plant; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 25; DB 24; Length 18691; 100.0%; Pred. The present invention describes a vector (I) comprising operably linked DNA fragments having: (a) origin of replication allowing replication in a recipient cell; preferably in bacteria such as Escherichia col; (b) selectable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (i) promoter or promoter region capable of being recognized by RNA polymerases of a cukaryotic cell or by prokaryotic RNA polymerase; (ii) first, second, third and fourth recombination sites; (iii) 3' transcription terminating and polyadenylation region functional in the eukaryotic cell. The first and polyadenylation sites, (iii) 3' transcription termination sites are capable of reacting with a same recombination site, and preferably are identical. The first and second recombination sites, or the third and fourth recombination sites, do not recombine with each the third and fourth recombination site. The vector is useful for producing large amounts of double-stranded RNA which can be used for silencing target nucleic acid sequences. The vectors can also be used to convert a DNA fragment into an inverted repeat structure. Plants

convert a DNA fragment into an inverted repeat structure. Plants

conventional breeding scheme to produce more plants with the same conventional breeding scheme to prime mine produce a chimeric general resource.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           characteristics or to introduce a chimeric gene for reduction of the phenotypic expression of nucleic acids. The present sequence represents an acceptor vector nucleotide sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 18691 BP; 4837 A; 4621 C; 4607 G; 4626 T; 0 other;

The invention relates to novel methods for cloning or subcloning one or more nucleic acid molecules (NAMS) comprising: (a) combining in vitro or in vivo: (l) at least one insert donor molecules (IDMS) comprising one or more desired nucleic acid segments flanked by at least 2 comprising one or more desired nucleic acid segments flanked by at least 2 recombination sites which do not recombine with each other; (2) one or more vector donor molecules (VDMS) comprising at least 2 recombination converse which do not recombine with each other; and (3) one or more sites which do not recombine with each other; and (3) one or more sites which do not recombine with each other; and (3) one or more sites which do not recombine with each other; and (3) one or more when or more of the desired segments into one or more of the methods can be used for the efficient and specific recombination of NAM segments. They can be used for changing vectors. The onethods can also be used for changing vectors. The oligonucleotides have the desired used for changing vectors. The oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               att recombination site; core region; mutation; enhance; recombination; vector; subcloning; regulation; exchange; ss.

AAT48210-25 are att recombination site core region DNA sequences. The core region has at least one engineered mutation that enhances recombination in vitro in the formation of a Cointegrate or Product DNA. These core regions can be incorporated into novel vector donor DNA molecules. The nucleic acids, vectors and methods of the invention are used to obtain chimeric nucleic acid using recombination proteins and engineered recombination sites in vitro or in vivo. The improved specificity, speed and yields of the invention facilitates DNA or RNA subcloning, regulation or exchange useful for any related purpose; e.g. in vitro recombination of DNA segments, and in vitro or in vivo insertion or modification of transcribed, replicated, isolated or genomic DNA or

in vivo: (1) at least one insert donor molecules (IDMs) comprising one or more desired nucleic acid segments flanked by at least 2 recombination sites which do not recombine with each other; (2) one or more vector donor molecules (VDMs) comprising at least 2 recombination sites which do not recombine with each other; and (3) one or more site-specific recombination proteins; (b) incubating the combination to transfer one or more of the desired segments into one or more of the wethods can be used for the efficient and specific recombination of NAM segments. They can be used to generate chimeric DNA or RNA molecules that have the desired characteristics and/or nucleic acid segments. The methods can also be used for changing vectors. The oligonucleotides AAX78935-X78994 are used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method for apposing an expression signal and a gene or partial gene, using recombinatorial cloning. The method incubates nucleic acids comprising the expression signal and the gene/ partial gene in the presence of a recombination protein under conditions sufficient to cause recombination and therefore appose the expression signal and the gene or partial gene. The methods are useful for apposing an expression signal and a gene or partial gene using recombinatorial cloning. The methods are also useful for changing vectors, constructing enes for fusion proteins, changing copy number, changing replicons, cloning into phages, and cloning e.g., PCR products (with an attB site at one end and a loxP site at the other end), genomic DNAs, and cDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Methods for apposing nucleic acids comprising an expression signal ar
a gene/partial gene, using recombinatorial cloning by incubating the
nucleic acids in the presence of a recombination protein under

The present invention relates to a method for in vitro cloning of a nucleic acid of interest. The method involves mixing in vitro two vectors acch comprising at least one recombination site and the nucleic acid of interest; incubating the mixture in the presence of at least one recombination protein to result in recombination of the recombination sites, leading to production of a chimeric nucleic acid molecule comprising the nucleic acid of interest; contacting hosts with the mixture; and selecting for a host comprising the chimeric nucleic acid molecule, and selecting gainst a host comprising the vectors comprising the second vector; to clone the nucleic acid. The present sequence is a recombinantion site, which may be used in the method of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        In vitro cloning of nucleic acid involves mixing vectors comprising recombination sites and/or nucleic acid, incubating mixture to produce chimeric molecule, contacting hosts with mixture and selecting host
The methods are highly specific, rapid, and less labour intensive than prior art methods. The present sequence is a recombination site useful for recombination cloning.
                                                                                                                               Gaps

The present invention describes an isolated mucleic acid molecule (I) comprising a first nucleic acid sequence having a defined sequence (AACB7866 to AACB7881, sequences complementary to AACB7881. Or an RNA sequence corresponding to AACB7866 to AACB7881. Also described are: (I) an isolated nucleic acid molecule (II) comprising a first mutated recombination site that removes one or more stop codons from the recombination site or avoids hairpin formation, the recombination site of a recombination site of a site (I) an isolated nucleic acid molecule (III) comprising a first att recombination site comprising a mutation that comprising a first att recombination site comprising a mutation that above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids; and (4) cells comprising the above mutative sites suitable for subcloning reactions. The use of nucleic acids for obtaining engineered recombination in vitro or in vivo makes the methods for NNA or RNA subcloning, highly specific, rapid, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated nucleic acid molecules comprising a DNA segment having two engineered recombination sites, derived from att or lox, which flank a selectable marker and comprise a core region having an engineered

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome cappression system (ACes) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing catificial chromosome, preferably an ACes. (II) is useful for producing carrier system, microinjection, microcall fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic microprojectile bombardment or direct DNA transfer into an embryonic coll, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACes comprising random portions of a genome. ACC44612 con ACC44732 and ABP96650 to ABP96657 represent sequences used in the construction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel eukaryotic chromosome comprising one or many att sites which permits site-directed integration in the presence of lambda-integrase, useful for site-specific recombination-directed integration of DNA of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lindenbaum M, Greene A, Leung J,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 23.4; DB 25;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present introduction describes a vector (1) complitatory introduction in a recipient cell, preferably in bacteria such as Escherichia coli; (1) selectable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (i) promoter or promoter or cell; and (c) a chimeric DNA construct comprising: (i) promoter or cell; and color prokaryotic RNA polymerases of a chimeric DNA prokaryotic RNA polymerases of a chiral dand fourth recombination sites; (iii) 3' transcription terminating and polyadenylation region functional in the eukaryotic cell. The first and polyadenylation region functional in the eukaryotic cell. The first can fourth recombination sites; (iii) 3' transcription termination sites are capable of reacting with a same recombination site, and preferably are identical. The first and second recombination sites, or the third and fourth recombination sites, do not recombination site, or producing large amounts of double-stranded RNA which can be used for producing large amounts of double-stranded RNA which can be used for producing large uncluded sequences. The vector is useful for convert a DNA fragment into an inverted repeat structure. Plants transformed with a vector from the present invention can be used to conventional breeding scheme to produce more plants with the same characteristics or to introduce a chimeric general sequence represents the convention of the phenotypic expression of nucleic acids. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

Sequence 11, Application US/10055001A

Publication No. US20030049835A1

Publication No. US20030049835A1

GENERAL INFORMATION:

APPLICANT: Wesley, Susan V.

APPLICANT: Wesley, Susan V.

APPLICANT: Wethod and means for producing efficient silencing constructs

TITLE OF INVENTION: Wethod and means for producing efficient silencing constructs

TITLE OF INVENTION: Using recombinational cloning

FILE REFERENCE: HELLGA

CURRENT APPLICATION NUMBER: US/10/055,001A

CURRENT FILING DATE: 2002-06-11

NUMBER OF SEQ ID NOS: 26

SOFTWARE: Patentin version 3.1
